the natural philosophy alliance npa sponsors regular international conferences for presenting high quality papers discussing aspects of philosophy in the sciences many papers offer challenges to accepted orthodoxy in the sciences especially in physics everything from the micro physics of quantum mechanics to the macro physics of cosmology is entertained though the main interest of the npa is in challenging orthodoxy in the sciences it will also feature papers defending such orthodoxy our ultimate propose is to enable participants to articulate their own understanding of the truth all papers are reviewed by society officers and sometimes by other members before presentation in conferences and they are edit sometimes very significantly prior to publication in the proceedings of the npa

there has been an increasing interest in multi disciplinary research on multisensor attitude estimation technology driven by its versatility and diverse areas of application such as sensor networks robotics navigation video biomedicine etc attitude estimation consists of the determination of rigid bodies orientation in 3d space this research area is a multilevel multifaceted process handling the automatic association correlation estimation and combination of data and information from several sources data fusion for attitude estimation is motivated by several issues and problems such as data imperfection data multi modality data dimensionality processing framework etc while many of these problems have been identified and heavily investigated no single data fusion algorithm is capable of addressing all the aforementioned challenges the variety of methods in the literature focus on a subset of these issues to solve which would be determined based on the application in hand historically the problem of attitude estimation has been introduced by grace wahba in 1965 within the estimate of satellite attitude and aerospace applications this book intends to provide the reader with both a generic and comprehensive view of contemporary data fusion methodologies for attitude estimation as well as the most recent researches and novel advances on multisensor attitude estimation task it explores the design of algorithms and architectures benefits and challenging aspects as well as a broad array of disciplines including navigation robotics biomedicine motion analysis etc a number of issues that make data fusion for attitude estimation a challenging task and which will be discussed through the different chapters of the book are related to 1 the nature of sensors and information sources accelerometer gyroscope magnetometer gps inclinometer etc 2 the computational ability at the sensors 3 the theoretical developments and convergence proofs 4 the system architecture computational resources fusion level

earth reinforcing techniques are increasingly becoming a useful powerful and economical solution to various problems encountered in geotechnical engineering practice expansion

of the experiences and knowledge in this area has succeeded in developing new techniques and their applications to geotechnical engineering problems in order to discuss the latest experiences and knowledge and with the purpose of spreading them all over the world for further development the kyushu conference series on the subject of earth reinforcement have been held in fukuoka japan every four years since 1988 this fourth symposium entitled landmarks in earth reinforcement is a continuation of the series is kyushu conferences and also aims at being one of the landmarks in the progress of modern earth reinforcement practice the first volume contains 137 papers selected for the symposium covering almost every aspect of earth reinforcement the second volume contains texts of the special and keynote lectures

new europe is a rhetorical term used by some analysts to describe european post communist transition success stories the term implies their recent return to european or more precisely western civilization but suggests given their forced communist detour that there is no single pan european identity in the eu this book examines the na

this book serves two main purposes firstly it shows in a simple way how the possible existence of an extra spatial dimension would affect the predictions of four dimensional general relativity a model known as the brane world secondly it explains step by step a new technique called minimal geometric deformation which was introduced for the purpose of solving the correspondingly modified einstein field equations this method gave rise to the gravitational decoupling in general relativity which is widely used to solve the einstein field equations in various contexts

the past few decades have witnessed the growth of the earth sciences in the pursuit of knowledge and understanding of the planet that we live on this development addresses the challenging endeavor to enrich human lives with the bounties of nature as well as to preserve the planet for the generations to come solid earth geophysics aspires to define and quantify the internal structure and processes of the earth in terms of the principles of physics and forms the intrinsic framework which other allied disciplines utilize for more specific investigations the first edition of the encyclopedia of solid earth geophysics was published in 1989 by van nostrand reinhold publishing company more than two decades later this new volume edited by prof harsh k gupta represents a thoroughly revised and expanded reference work it brings together more than 200 articles covering established and new concepts of geophysics across the various sub disciplines such as gravity geodesy geomagnetism seismology seismics deep earth processes plate tectonics thermal domains computational methods etc in a systematic and consistent format and standard it is an authoritative and current reference source with extraordinary width of scope it draws its unique strength from the expert contributions of editors and authors across the globe it is designed to serve as a valuable and cherished source of information for current and future generations of professionals

currently the general theory of relativity gtr describes the physics of the very large in terms of classical physics while quantum theory describes the physics of the very small in terms of the standard model of particle physics unfortunately the two theories are incompatible and do not describe satisfactorily all the forces between the various particles comprising ordinary matter at present one of the deepest problems in theoretical physics is harmonizing the gtr which describes gravitation with quantum mechanics which describes the other three fundamental forces acting on the atomic scale the main aim of the book is to provide an understanding of gravity in terms of a quantum theory given by the generation model of particle physics the book presents a fully quantum theory of gravity which describes both the large cosmological scale and the small atomic scale interactions between all particles
